A Snapshot of Homelessness in the Colorado Balance of State Continuum of Care:
2016 Homeless Point in Time Study
June 2016
Acknowledgements

We would like to acknowledge the participation and support of the following people and organizations for the successful completion of the 2016 Point in Time (PIT) count for the Colorado Balance of State CoC.

Colorado Coalition for the Homeless
   Rosalyn Wheeler-Bell, Director, Rural Initiatives and Emergency Solutions Grant.
   Tom Power, Technical Assistance Coordinator, Rural Initiatives Program
   Mandy Graves May, Vice President of Quality Assurance (some parts of the text from the 2013 report are included in this report).

A special thank you goes out to the Regional PIT Coordinators and their many volunteers.

I. Introduction

The Point in Time (PIT) study is an annual count of homeless individuals and families. This study is conducted across the country and Colorado has participated in this study every year. The count of homeless people assists in the US Department of Housing and Urban Development’s (HUD) assessment of the needs of the current homeless population. This report is a summary of Colorado’s Balance of State Continuum of Care. The Balance of State area includes all counties in Colorado except Metro Denver and Colorado Springs. The Point in Time count was conducted for the night of January 26, 2016. Regional coordinators throughout the Balance of State were responsible for recruiting volunteers, providing information to agencies in their respective areas, and requesting agency participation. Of the 56 counties in the Balance of State region, 21 participated in the collection of data for the 2016 PIT survey.

The PIT survey captures a snapshot of individuals and households currently experiencing homelessness. The number of people who are homeless is not static. It is constantly changing due to a number of economic, psychological, physical, and social factors that can have temporary or long-term effects. HUD defines chronic homelessness as either having lived on the streets or any place not meant for human habitation for more than one year, or having slept on the street or any place not meant for human habitation more than four times over the past three years, and having at least one identified disability. The following disabilities were collected, via self-report, on the Point-In-Time: substance abuse, severe mental illness, chronic physical illness, posttraumatic stress disorder (PTSD), traumatic brain injury (TBI), developmental disability, and HIV/AIDS. The current report highlights the key findings of the Balance of State point-in-time survey. This summary includes information on risk factors and demographic information of the current chronically homeless population. Methods and limitations of the implementation and analysis of the point-in-time survey for the Balance of State region will be discussed, as well as possible recommendations for the future.

II. Methodology

The forms and data collection process was designed by CCH, based on the HUD PIT Guidance documents. On January 26, 2016, service providers and other volunteers administered these surveys to sheltered homeless people throughout the Balance of State. From these surveys data were collected on the head of the household, as well as information for all family members. To ensure unduplicated responses, the first three letters of each respondent’s first and last names were reported for each family member. Variables collected from each respondent included where he/she slept on January 26, 2016, incidence of homelessness and shelter use in the past year, number of persons in the family, age, gender, veteran status, and incidence of disabilities in the family.

There are a few limitations that should be noted as a result of the survey administration techniques. First, due to the transient nature of the population and the large geographic area of the Balance of State, it is extremely difficult to capture all homeless individuals and families.
Furthermore, not all homeless service providers in the Balance of State participated in the survey. Therefore, the following findings should be considered as an underrepresentation of homelessness in the Balance of State. Second, many survey forms had missing or contradictory information. Due to this missing information, some measures, such as incidence of disability, may also be underrepresented. When contradictions arose, surveys were either corrected or discarded, if necessary, to minimize error. Third, this survey is based on self-reporting, which may introduce some bias in the data. For example, some people may not report a physical disability even though most people would agree that the individuals have a disability. In addition, there is a stigma associated with reporting mental health problems such as PTSD and some individuals would not report PTSD even though most professionals would agree that the individuals have PTSD.

III. Findings

In the Colorado Balance of State Continuum of Care there were 1689 homeless women, men and children counted on January 26, 2016. Of these 1689 homeless people, 182 (10.8%) were considered chronically homeless.

*Chart 1: Number of Respondents by County*

*Count includes head of household and any subsequent family members.*
DEMOGRAPHICS

1. Family Type
There were 843 adults-only families, 621 families with at least one adult and one child, 73 families of youth with their children, 75 unaccompanied youth, 2 families of adults and youth, and 75 families composed of individuals from all three age groups. There were no families of unaccompanied youth under 18.

2. Age
Respondents reported the age ranges (under 18; 18-24; above 24) for themselves and family members. Exact ages were not asked; therefore, average ages cannot be reported. The majority of respondents (n=1090, 64.5%) were over 24 years old. According to the National Center on Family Homelessness, approximately 36% of the total homeless population (note: not necessarily chronically homeless) is estimated to be children (2011). In comparison, 27% of the Balance of State population was children.

**RISK FACTORS**

1. Disabilities

   Respondents were asked to report lifetime incidence for all family members of substance abuse, serious mental illness, chronic physical illness, Post Traumatic Stress Disorder, traumatic brain injury, developmental disability, and HIV/AIDS. The most reported disability was chronic physical illness (n=265, 15.7%). For all respondents, 601 (35.6%) reported having multiple disabilities (2 or more).

</tr>
</tbody>
</table>

Self-identified disabilities had implications for chronic homelessness. Additionally, Charts 4 illustrates that 29% of respondents with reported mental illness, 32.9% of individuals with a substance use disorder, 23.4% of respondents reporting a chronic physical illness, 28.7% of respondents reporting a developmental disability, 28.3% of respondents reporting PTSD, and 27.4% of those reporting TBI met criteria for chronic homelessness, respectively.

Chart 4: Disabilities
2. Veteran Status

Each respondent was asked if he/she had ever served in the armed forces. The majority of respondents reported “no” (n=1556, 92.1%). Of the 133 that reported “yes,” 16.5% (n=22) met criteria for chronic homelessness. In addition, there were only 9 female veterans surveyed.

Summary

Homelessness continues to be a critical issue in communities across Colorado. In fact, both homelessness and chronic homelessness appear to have increased substantially from 2013. There was a 50% increase in the number of people reported as homeless from 2013 to 2015 in the Balance of State in Colorado. While not all counties reported in either year, fewer counties reported in the 2015 survey. Many of the counties that reported in both years showed an increase in the number of people who were homeless in 2015. Consequently, it is likely that there has been an increase in homelessness from 2013 to 2015 in the Balance of the State in Colorado. Also, the number of people who are chronically homeless has increased from 534 to 758 in 2015. The majority of the people who were chronically homeless were adults (25 years and older), male, and single. This trend is consistent with national data from HUD (AHAR, 2009).

Only people in emergency shelters and transitional housing programs are included in the 2016 survey. There was very little change in the number of reported sheltered homeless people from 2015 to 2016 (1716 in 2015; 1689 in 2016). However, there was a 28% increase in the reported number of sheltered homeless people from 2013 to 2016. Also, the percentage of homeless people considered chronically homeless was 10.8% in this survey. Last year (2015)
the percentage was 13%. In 2013 the percentage was 15%. Consequently, there has been a slight drop in the percentage of homeless people considered chronically homeless since 2013.

There are recommendations for future Point in Time studies for the Balance of State. First, there were a number of homeless service agencies, and counties that didn’t participate in the survey. Therefore, generalizing results to the entire Balance of State geographical area is difficult. Increasing agency participation would create a more comprehensive overview of homelessness in Colorado. Also, the data on disabilities could be improved. There were missing data for disability on some of the forms. Also, it is likely that the reported data underrepresents the number of people with disabilities. Improved data would provide a more accurate assessment of community needs and would help to demonstrate the seriousness of homelessness. The participation of more agencies and more counties would also establish the basis for a greater collaboration on efforts to reduce homelessness.

Other measures may be under-represented because some form items can only apply to the head of household. For example, the sleeping location of the family was not assumed for subsequent household members based on the head of household’s response.
